8.1303.1 Detailed Description

This structure contains the IPv4 filter address

Parameters

addr	IPv4 address
subnetMask	A packet matches if: • (addr and subnetMask) == (IP pkt addr & subnetMask) Callers to set up a filter with a range of source addresses, if needed; subnet mask of all 1s (255.255.255.255) specifies a single address value

Data Fields

- uint8_t addr [16]
- uint8_t prefixLen

8.1304.1 Detailed Description

This structure contains the IPv6 filter address

Parameters

addr	IPv6 address (in network byte order); this is a 16-byte byte array (in Big-endian format)
prefixLen	IPv6 filter prefix length; can take a value between 0 and 128 Note: A packet matches if the IPv6 source address bytes until the prefix lengths are equal. Therefore prefix length can be used to set a filter with a range of source addresses. A prefix length of 128 specifies a single address value.

- uint8_t mask

8.1305.1 Detailed Description

This structure contains the IPv6 filter traffic class

Parameters

val	The traffic class value
mask	The packet matches the traffic class filter if: (IPv6_filter_traffic_class_val and IPv6_filter_traffic_class_mask) == (Traffic class value in the IP packet & IPv6_filter_traffic_class_mask) Example: • IPv6_filter_tc_val = 00101000 • IPv6_filter_tc_mask = 11111100 Filter will compare only the first 6 bits in IPv6_filter_traffic_class with the first 6 bits in the traffic class field of the IP packet; first 6 bits in the traffic class field of the IP packet must be 001010 to match filter; last 2 bits can be anything, since they are ignored by filtering

8.1318.1 Detailed Description

This structure contains the QoS Flow Request.

Please check is_<Param_Name>_Available field for presence of optional parameters

Parameters

index	• Mandatory parameter • IP flow index • Integer that uniquely identifies each flow instance • Unique index must be assigned by the control point to every flow_spec instance

ProfileId3GPP2	• IP flow 3GPP2 profile ID • A profile ID is shorthand for a defined set of QoS flow parameters specified by the network; to be present while requesting QoS for a CDMA device
val_3GPP2Pri	• IP flow 3GPP2 flow priority • Flow priority used by the network in case of contention between flows with same QoS; this parameter applies for CDMA devices
TrafficClass	• IP flow traffic class • Integer that designates the requested traffic class: • 0 - Conversational • 1 - Streaming • 2 - Interactive • 3 - Background
DataRate	• IP flow data rate min max • See unpack_qos_dataRate_t for more information
TokenBucket	• IP flow data rate token bucket • See unpack_qos_tokenBucket_t for more information
Latency	• IP flow latency • Maximum delay (in milliseconds) that can be tolerated by an IP packet during transfer through the wireless link
Jitter	• IP flow jitter • Difference between the maximum and minimum latency (in milliseconds) that can be tolerated by an IP packet during the transfer through the wireless link
PktErrRate	• IP flow packet error rate • See unpack_qos_pktErrRate_t for more information
MinPolicedPktSz	• IP flow minimum policed packet size • Integer that defines the minimum packet size (in bytes) that will be policed for QoS guarantees; any IP packets that are smaller than the minimum specified policed size may not receive requested QoS
MaxAllowedPkt-Sz	• IP flow maximum allowed packet size • Integer that defines the maximum packet size (in bytes) allowed in the IP flow; any IP packets greater in size than the maximum allowed packet size are not queued for transmission

val_3GPPRes-ResidualBER	• IP flow 3GPP residual bit error rate • residual_bit_error_rate • 0 = 5∗10-2 residual BER • 1 = 1∗10-2 residual BER • 2 = 5∗10-3 residual BER • 3 = 4∗10-3 residual BER • 4 = 1∗10-3 residual BER • 5 = 1∗10-4 residual BER • 6 = 1∗10-5 residual BER • 7 = 1∗10-6 residual BER • 8 = 6∗10-8 residual BER • Integer that indicates the undetected BER for each IP flow in the delivered packets; Tapplies only to 3GPP networks
val_3GPPTra-HdlPri	• 3GPP traffic handling priority • 0 - Relative traffic handling priority 1 • 1 - Relative traffic handling priority 2 • 2 - Relative traffic handling priority 3 • Defines the relative priority of the flow; applies only to 3GPP networks
val_3GPPImCn	• IP flow 3GPP IM CN flag • IM CN subsystem signaling flag: • 0x00 - FALSE • 0x01 - TRUE • This parameter applies only to 3GPP networks
val_3GPPSigInd	• IP flow 3GPP signaling indication • 0x00 - FALSE • 0x01 - TRUE • This parameter applies only to 3GPP networks
LteQci	• LTE QoS Class Identifier • QoS Class Identifier(QCI) is a required parameter to request QoS in LTE • QCI values: – QCI value 0 requests the network to assign the appropriate QCI value – QCI values 1-4 are associated with guaranteed bitrates – QCI values 5-9 are associated with nonguaranteed bitrates, so the values specified as guaranteed and maximum bitrates are ignored

Data Fields

- uint8_t val
- uint8_t mask

8.1320.1 Detailed Description

This structure contains the IPv4 filter type of service

Parameters

val	Type of service value
mask	Packet matches the TOS filter if: (IPv4_filter_tos_val and IPv4_filter_tos_mask) == (TOS value in the IP packet & IPv4_filter_tos_mask) Example: • IPv4_filter_tos_val = 00101000 • IPv4_filter_tos_mask = 11111100 The filter will compare only the first 6 bits in the IPv4_filter_-type_of_service with the first 6 bits in the TOS field of the IP packet. The first 6 bits in the TOS field of the IP packet must be 001010 to match the filter. The last 2 bits can be anything since they are ignored by filtering.

9.5.1.2 #define LOCEVENTMASKBATCHFULLNOTIFICATION 0x00080000

The control point must enable this mask to receive notification when a batch is full. The location engine sends this event to notify of Batch Full for ongoing batching session.

9.5.1.3 #define LOCEVENTMASKENGINESTATE 0x00000080

The control point must enable this mask to receive engine state report event indications.

9.5.1.4 #define LOCEVENTMASKFIXSESSIONSTATE 0x00000100

The control point must enable this mask to receive fix session status report event indications.

9.5.1.5 #define LOCEVENTMASKGEOFENCEBATCHBREACHNOTIFICATION 0x00400000

The control point must enable this mask to receive notifications when a Geofence is breached. These events are generated when a UE enters or leaves the perimeter of a Geofence. This breach notification is for multiple Geofences. Breaches from multiple Geofences are all batched and sent in the same notification.

9.5.1.6 #define LOCEVENTMASKGEOFENCEBREACHNOTIFICATION 0x00010000

The control point must enable this mask to receive notifications when a Geofence is breached. These events are generated when a UE enters or leaves the perimeter of a Geofence. This breach report is for a single Geofence.

9.5.1.7 #define LOCEVENTMASKGEOFENCEGENALERT 0x00008000

The control point must enable this mask to receive Geofence alerts. These alerts are generated to inform the client of the changes that may affect a Geofence, for example, if GPS is turned off or if the network is unavailable.

9.5.1.8 #define LOCEVENTMASKGNSSMEASUREMENTREPORT 0x01000000

The control point must enable this mask to receive system clock and satellite measurement report events (system clock, SV time, Doppler, etc.). Reports are generated only for the GNSS satellite constellations that are enabled using QMI_LOC_SET_GNSS_ CONSTELL_REPORT_CONFIG(Not yet supported).

9.5.1.9 #define LOCEVENTMASKGNSSSVINFO 0x00000002

The control point must enable this mask to receive satellite report event indications. These reports are sent at a 1 Hz rate.

9.15.4.26 ULONG upgrade_mc77xx_fw (LPCSTR *path*)

9.15.4.27 ULONG UpgradeFirmware2k (CHAR * *pDestinationPath*)

This API is used to download firmware to a MC77xx or Gobi 3000 device. For SL909/MC9090, SLQSSetSpkgFormatRequired() needs to be called in advance to specify the download method, Gobi3K or SPKG download, please refer to the API SLQSSetSpkgFormatRequired() for more details of the input values. If SLQSSetSpkgFormatRequired() is not called in advance, it will us Gobi3K firmware download method (MBN files) as the default download method.

This API Performs the following steps:

1. Verifies arguments.
2. Verify that device Crash State should be 1 (RESET State).
3. Informs the SDK of the firmware upgrade path
4. Updates the images preference on the currently connected device.
5. Requests the device reset (device will reset after all open handles are released).

   Upon successful completion, the above steps will have been completed, however, the actual upgrade of the firmware will necessarily then follow.

Parameters

pDestination-Path[IN]	• fully qualified path to firmware image to download. The path must end with a forward slash. For a Gobi 3000 device the path should specify the carrier image folder index i.e. "<path\to\carrier\image>/<carrier index>/" where <carrier index>=""> is a valid sub-directory entry. For 9x30 devices if pDestinationPath is not valid on host, it will use pseudo path for image switching.

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

9.35.3 Coding Group Bits 7..4(0001)

9.35.3.1 use of bits 3..0

- 0000 GSM 7 bit default alphabet; message preceded by language indication.
  The first 3 characters of the message are a two-character representation of the language encoded according to ISO 639 [12], followed by a CR character. The CR character is then followed by 90 characters of text.
- 0001 UCS2; message preceded by language indication
  The message starts with a two GSM 7-bit default alphabet character representation of the language encoded according to ISO 639. This is padded

to the octet boundary with two bits set to 0 and then followed by 40 characters
of UCS2-encoded message.
An MS not supporting UCS2 coding will present the two character language
identifier followed by improperly interpreted user data.

Some versions of the modem support the Dual SIM feature. With this feature the modem can register with two different cellular networks simultaneously. Each network registration is associated with a different subscription, e.g., phone number, such that the modem appears to the network to be two different users. By default, the Voice client is bound to the primary subscription. This command allows the Voice client to change this binding. After receiving a successful response to this command, all future commands sent by the client will affect the newly bound subscription only.

9.49.5.59 ULONG SLQSWdsSetEventReport (wdsSetEventReportReq * *pSetEventReportReq*)

This API sets the wireless data connection state reporting conditions for the requesting control point.

Parameters

pSetEventReportReq[IN]	• See wdsSetEventReportReq for more information.

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

See Also

See qmerrno.h for eQCWWAN_xxx error values

Note

Timeout: 2 seconds
The control point event reporting state variables are modified to reflect the settings indicated in the request message. The service maintains a set of state variables for each control point. Relevant wireless data connection state changes are communicated to the registered WDS control point via the SLQSWdsSetEventReportCallBack. The AT command equivalents to this command are AT+CMER, AT+CIND, and AT+CIEV

9.49.5.60 ULONG SLQSWdsSwiPDPRuntimeSettings (swiPDPRuntimeSettingsReq * *pPDPRuntimeSettingsReq,* swiPDPRuntimeSettingsResp * *pPDPRuntimeSettingsResp*)
