**Parameters**

| | |
|---|---|
| *addr* | IPv4 address |
| *subnetMask* | A packet matches if:<br>• (addr and subnetMask) == (IP pkt addr & subnetMask) Callers to set up a filter with a range of source addresses, if needed; subnet mask of all 1s (255.255.255.255) specifies a single address value |

- uint8_t prefixLen

### 8.1312.1 Detailed Description

This structure contains the IPv6 filter address

**Parameters**

| | |
|---|---|
| *addr* | IPv6 address (in network byte order); this is a 16-byte byte array (in Big-endian format) |
| *prefixLen* | IPv6 filter prefix length; can take a value between 0 and 128 Note: A packet matches if the IPv6 source address bytes until the prefix lengths are equal. Therefore prefix length can be used to set a filter with a range of source addresses. A prefix length of 128 specifies a single address value. |

### 8.1327.1 Detailed Description

This structure contains the QoS Flow Request.

Please check is_<Param_Name>_Available field for presence of optional parameters

**Parameters**

| | |
|---|---|
| *index* | • Mandatory parameter<br>• IP flow index<br>• Integer that uniquely identifies each flow instance<br>• Unique index must be assigned by the control point to every flow_spec instance |
| *ProfileId3GPP2* | • IP flow 3GPP2 profile ID<br>• A profile ID is shorthand for a defined set of QoS flow parameters specified by the network; to be present while requesting QoS for a CDMA device |
| *val_3GPP2Pri* | • IP flow 3GPP2 flow priority<br>• Flow priority used by the network in case of contention between flows with same QoS; this parameter applies for CDMA devices |
| *TrafficClass* | • IP flow traffic class<br>• Integer that designates the requested traffic class:<br>• 0 - Conversational<br>• 1 - Streaming<br>• 2 - Interactive<br>• 3 - Background |
| *DataRate* | • IP flow data rate min max<br>• See unpack_qos_dataRate_t for more information |

## 8.1329 unpack_qos_Tos_t Struct Reference

### Data Fields

- uint8_t val
- uint8_t mask

### 8.1329.1 Detailed Description

This structure contains the IPv4 filter type of service

**Parameters**

| | |
|---|---|
| *val* | Type of service value |
| *mask* | Packet matches the TOS filter if: (IPv4_filter_tos_val and IPv4_filter_tos_mask) == (TOS value in the IP packet & IPv4_filter_tos_mask) Example:<br>• IPv4_filter_tos_val = 00101000<br>• IPv4_filter_tos_mask = 11111100 The filter will compare only the first 6 bits in the IPv4_filter_-type_of_service with the first 6 bits in the TOS field of the IP packet. The first 6 bits in the TOS field of the IP packet must be 001010 to match the filter. The last 2 bits can be anything since they are ignored by filtering. |

### 9.5.1.3 #define LOCEVENTMASKENGINESTATE 0x00000080

The control point must enable this mask to receive engine state report event indications.

#### 9.5.1.4 #define LOCEVENTMASKFIXSESSIONSTATE 0x00000100

The control point must enable this mask to receive fix session status report event indications.

#### 9.5.1.5 #define LOCEVENTMASKGEOFENCEBATCHBREACHNOTIFICATION 0x00400000

The control point must enable this mask to receive notifications when a Geofence is breached. These events are generated when a UE enters or leaves the perimeter of a Geofence. This breach notification is for multiple Geofences. Breaches from multiple Geofences are all batched and sent in the same notification.

#### 9.5.1.6 #define LOCEVENTMASKGEOFENCEBREACHNOTIFICATION 0x00010000

The control point must enable this mask to receive notifications when a Geofence is breached. These events are generated when a UE enters or leaves the perimeter of a Geofence. This breach report is for a single Geofence.

#### 9.5.1.7 #define LOCEVENTMASKGEOFENCEGENALERT 0x00008000

The control point must enable this mask to receive Geofence alerts. These alerts are generated to inform the client of the changes that may affect a Geofence, for example, if GPS is turned off or if the network is unavailable.

#### 9.5.1.8 #define LOCEVENTMASKGNSSMEASUREMENTREPORT 0x01000000

The control point must enable this mask to receive system clock and satellite measurement report events (system clock, SV time, Doppler, etc.). Reports are generated only for the GNSS satellite constellations that are enabled using QMI_LOC_SET_GNSS_ CONSTELL_REPORT_CONFIG(Not yet supported).

#### 9.5.1.9 #define LOCEVENTMASKGNSSSVINFO 0x00000002

The control point must enable this mask to receive satellite report event indications. These reports are sent at a 1 Hz rate.

Invalid Event Mask

#### 9.5.1.15 #define LOCEVENTMASKLIVEBATCHEDPOSITIONREPORT 0x00100000

The control point must enable this mask to receive position report indications along with an ongoing batching session. The location engine sends this event to notify the batched position report while a batching session is ongoing.

#### 9.5.1.16 #define LOCEVENTMASKLOCATIONSERVERCONNECTIONREQ 0x00002000

The control point must enable this mask to receive location server requests. These requests are generated when the service wishes to establish a connection with a location server.

#### 9.5.1.17 #define LOCEVENTMASKMOTIONDATACONTROL 0x00040000

The control point must enable this mask to register for motion data control requests from the location engine. The location engine sends this event to control the injection of motion data.

#### 9.5.1.18 #define LOCEVENTMASKNIGEOFENCENOTIFICATION 0x00004000

**Returns**

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

**See Also**

see qmerrno.h for eQCWWAN_xxx error values

**Note**

Timeout: 2 seconds API is useful to register for the services which supports unsolicited notifications. Registration/deregistration can be done by using parameter action if action is set then the mask (set bits) will be used for registering service and if action is "0" mask(set bits) will be used to deregister services. For example : bit mask 0x03 - Registers for services WDS and NAS if action is "1" and deregisters WDS and NAS if action is "0".

This API is used to download firmware to a specific slot id of the modem. It is only applicable for EM74xx variant. This API encapsulates all steps involved in the firmware download process.Hence it is a blocking API call.

This API will not return until the entire process has been completed. This API will takes significant amount of time (in order of minutes, normally should be less than 10 minutes).

This API Performs the following steps:

1. Verifies arguments.
2. Retrieve and store the details of the firmware and the PRI file
3. Enable device state change callback.
4. Enable firmware download callback.
5. Set Image preference on the device and reset the device.
6. Wait for the firmware to download and device to become ready.
7. Check the firmware update status. If fail, return an error.
8. If update status is OK, check if current image preference and preferred image preference( from step 2 ) match
9. If match, firmware download is successful. otherwise, report FW_PREFERENCE_MISMATCH

   10.Disable callbacks and exit.

   The call to this API blocks until step 7 or 10. This could be a significant amount of time ( in order of minutes ). Also note that the device state change callback and firmware download callback are used internally

   within this API. Hence the user application's instance of these callbacks (if any) are cleared. The user must re-enable these callbacks after a call to this API in order to use them.

### 9.35.3 Coding Group Bits 7..4(0001)

#### 9.35.3.1 use of bits 3..0

- 0000 GSM 7 bit default alphabet; message preceded by language indication.
  The first 3 characters of the message are a two-character representation of the language encoded according to ISO 639 [12], followed by a CR character. The CR character is then followed by 90 characters of text.
- 0001 UCS2; message preceded by language indication
  The message starts with a two GSM 7-bit default alphabet character representation of the language encoded according to ISO 639. This is padded

to the octet boundary with two bits set to 0 and then followed by 40 characters
of UCS2-encoded message.
An MS not supporting UCS2 coding will present the two character language
identifier followed by improperly interpreted user data.

This API sets a line to be switchable or unswitchable, and the switch status is updated on the card. The API is supported only for specific SIM/USIMs that support alternate line service. This command is applicable only in 3GPP devices. A No Effect error is returned if the update on the card fails.

#### 9.48.4.7 ULONG SLQSVoiceAnswerCall ( voiceAnswerCall * *pVoiceAnswerCall* )

Answers an incoming voice call.

**Parameters**

| | |
|---|---|

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

**See Also**

See qmerrno.h for eQCWWAN_xxx error values

**Note**

Timeout: 10 Secs
This API is used to answer an incoming voice call when the incoming voice call is the only call present at that time. If there are other calls while an incoming call (waiting call) is received, API "SLQSVoiceSendFlash" can be used case of 3GPP2(CDMA) and API "SLQSVoiceManageCalls" in the case of 3GPP(UMTS). If the result indicates success, the device has started the requested operation and it does not mean that the call has been answered. "SLQSVoiceSetAllCallStatusCallback" can be subscribed to check the call Information/State.

#### 9.48.4.8 ULONG SLQSVoiceBindSubscription ( voiceBindSubscriptionInfo * *pVoiceBindSubscriptionInfo* )

This API binds a subscription type to a specific voice client ID.

**Parameters**

**See Also**

See qmerrno.h for eQCWWAN_xxx error values

**Note**

Timeout: 30 Secs
Some versions of the modem support the Dual SIM feature. With this feature the modem can register with two different cellular networks simultaneously. Each network registration is associated with a different subscription, e.g., phone number, such that the modem appears to the network to be two different users. By default, the Voice client is bound to the primary subscription. This command allows the Voice client to change this binding. After receiving a successful response to this command, all future commands sent by the client will affect the newly bound subscription only.

#### 9.48.4.9 ULONG SLQSVoiceBurstDTMF ( voiceBurstDTMFInfo * *pBurstDTMFInfo* )
