8.1396.1 Detailed Description

This structure contains the IPv6 filter address

Parameters

addr	IPv6 address (in network byte order); this is a 16-byte byte array (in Big-endian format)
prefixLen	IPv6 filter prefix length; can take a value between 0 and 128 Note: A packet matches if the IPv6 source address bytes until the prefix lengths are equal. Therefore prefix length can be used to set a filter with a range of source addresses. A prefix length of 128 specifies a single address value.

val	The traffic class value
mask	The packet matches the traffic class filter if: (IPv6_filter_traffic_class_val and IPv6_filter_traffic_class_mask) == (Traffic class value in the IP packet & IPv6_filter_traffic_class_mask) Example: • IPv6_filter_tc_val = 00101000 • IPv6_filter_tc_mask = 11111100 Filter will compare only the first 6 bits in IPv6_filter_traffic_class with the first 6 bits in the traffic class field of the IP packet; first 6 bits in the traffic class field of the IP packet must be 001010 to match filter; last 2 bits can be anything, since they are ignored by filtering

8.1410.1 Detailed Description

This structure contains the QoS Filter Request.

Please check is_<Param_Name>_Available field for presence of optional parameters

Parameters

index	Mandatory parameter IP filter index Integer that uniquely identifies each filter instance This TLV must be present in the request
version	Mandatory parameter IP filter version Identifies whether the filter is associated with IPv4 or IPv6; value specified also implies that only TLVs defined for that IP version, i.e., TLVs with IPv4 or IPv6 in the name, can be specified • 0x04 - IPv4 • 0x06 - Ipv6
IPv4SrcAddr	IPv4 filter soruce address See unpack_qos_IPv4Addr_t for more information • Implemented only for unsolicited indication
IPv4DstAddr	IPv4 filter destination address See unpack_qos_IPv4Addr_t for more information • Implemented only for unsolicited indication
NxtHdrProto	IP filter next header protocol This TLV must be present if any non-IP filter TLV(s) are provided If this field is specified, only IP packets belonging to specified higher layer protocol are considered when filtering The following protocols may be specified: • 0x01 = ICMP • 0x06 = TCP • 0x11 = UDP • 0x32 = ESP Note: The next header protocol field will be set to 0xFD (TCP & UDP) if a TFT is received specifying a source or destination port number, but IP next header type is not specified.
IPv4Tos	IPv4 filter type of service See unpack_qos_Tos_t for more information
IPv6SrcAddr	IPv6 filter soruce address See unpack_qos_IPv6Addr_t for more information • Implemented only for unsolicited indication
IPv6DstAddr	IPv6 filter destination address See unpack_qos_IPv6Addr_t for more information • Implemented only for unsolicited indication
IPv6TrafCls	IPv6 filter traffic class See unpack_qos_IPv6TrafCls_t for more information
IPv6Label	IPv6 flow label Packet matches the IPv6 flow label filter if: (∗pIPv6Label == flow label in the IPv6 header) • Implemented only for unsolicited indication
TCPSrcPort	TCP filter source port filter See unpack_qos_Port_t for more information • Implemented only for unsolicited indication
TCPDstPort	TCP filter destination port filter See unpack_qos_Port_t for more information • Implemented only for unsolicited indication
UDPSrcPort	UDP filter source port filter See unpack_qos_Port_t for more information • Implemented only for unsolicited indication
UDPDstPort	UDP filter destination port filter See unpack_qos_Port_t for more information • Implemented only for unsolicited indication

EspSpi	ESP filter security policy index Security policy index to uniquely identify each IP flow for filtering encrypted packets for encapsulating security payload • Implemented only for unsolicited indication
Precedence	Filter Precedence Specifies the order in which filters are applied; lower numerical value has higher precedence Note: This TLV only applies to network-initiated QoS; QoS requests containing this TLV from control points will be ignored
Id	Filter ID Unique identifier for each filter;filter ID is assigned by the modem Note: This TLV only applies to network-initiated QoS; QoS requests containing this TLV from control points will be ignored
TranSrcPort	Transport protocolfilter source port See unpack_qos_Port_t for more information • Implemented only for unsolicited indication
UDPDstPort	Transport protocol filter destination port See unpack_qos_Port_t for more information • Implemented only for unsolicited indication

8.1411.1 Detailed Description

This structure contains the QoS Flow Request.

Please check is_<Param_Name>_Available field for presence of optional parameters

Parameters

index	• Mandatory parameter • IP flow index • Integer that uniquely identifies each flow instance • Unique index must be assigned by the control point to every flow_spec instance
ProfileId3GPP2	• IP flow 3GPP2 profile ID • A profile ID is shorthand for a defined set of QoS flow parameters specified by the network; to be present while requesting QoS for a CDMA device
val_3GPP2Pri	• IP flow 3GPP2 flow priority • Flow priority used by the network in case of contention between flows with same QoS; this parameter applies for CDMA devices
TrafficClass	• IP flow traffic class • Integer that designates the requested traffic class: • 0 - Conversational • 1 - Streaming • 2 - Interactive • 3 - Background
DataRate	• IP flow data rate min max • See unpack_qos_dataRate_t for more information

TokenBucket	• IP flow data rate token bucket • See unpack_qos_tokenBucket_t for more information
Latency	• IP flow latency • Maximum delay (in milliseconds) that can be tolerated by an IP packet during transfer through the wireless link
Jitter	• IP flow jitter • Difference between the maximum and minimum latency (in milliseconds) that can be tolerated by an IP packet during the transfer through the wireless link
PktErrRate	• IP flow packet error rate • See unpack_qos_pktErrRate_t for more information
MinPolicedPktSz	• IP flow minimum policed packet size • Integer that defines the minimum packet size (in bytes) that will be policed for QoS guarantees; any IP packets that are smaller than the minimum specified policed size may not receive requested QoS
MaxAllowedPktSz	• IP flow maximum allowed packet size • Integer that defines the maximum packet size (in bytes) allowed in the IP flow; any IP packets greater in size than the maximum allowed packet size are not queued for transmission
val_3GPPResResidualBER	• IP flow 3GPP residual bit error rate • residual_bit_error_rate • 0 = 5∗10-2 residual BER • 1 = 1∗10-2 residual BER • 2 = 5∗10-3 residual BER • 3 = 4∗10-3 residual BER • 4 = 1∗10-3 residual BER • 5 = 1∗10-4 residual BER • 6 = 1∗10-5 residual BER • 7 = 1∗10-6 residual BER • 8 = 6∗10-8 residual BER • Integer that indicates the undetected BER for each IP flow in the delivered packets; Tapplies only to 3GPP networks
val_3GPPTraHdlPri	• 3GPP traffic handling priority • 0 - Relative traffic handling priority 1 • 1 - Relative traffic handling priority 2 • 2 - Relative traffic handling priority 3 • Defines the relative priority of the flow; applies only to 3GPP networks

val_3GPPImCn	• IP flow 3GPP IM CN flag • IM CN subsystem signaling flag: • 0x00 - FALSE • 0x01 - TRUE • This parameter applies only to 3GPP networks
val_3GPPSigInd	• IP flow 3GPP signaling indication • 0x00 - FALSE • 0x01 - TRUE • This parameter applies only to 3GPP networks
LteQci	• LTE QoS Class Identifier • QoS Class Identifier(QCI) is a required parameter to request QoS in LTE • QCI values: – QCI value 0 requests the network to assign the appropriate QCI value – QCI values 1-4 are associated with guaranteed bitrates – QCI values 5-9 are associated with nonguaranteed bitrates, so the values specified as guaranteed and maximum bitrates are ignored

Data Fields

- uint8_t val
- uint8_t mask

8.1413.1 Detailed Description

This structure contains the IPv4 filter type of service

Parameters

val	Type of service value
mask	Packet matches the TOS filter if: (IPv4_filter_tos_val and IPv4_filter_tos_mask) == (TOS value in the IP packet & IPv4_filter_tos_mask) Example: • IPv4_filter_tos_val = 00101000 • IPv4_filter_tos_mask = 11111100 The filter will compare only the first 6 bits in the IPv4_filter_-type_of_service with the first 6 bits in the TOS field of the IP packet. The first 6 bits in the TOS field of the IP packet must be 001010 to match the filter. The last 2 bits can be anything since they are ignored by filtering.

9.15.4.9 ULONG SLQSDownloadFirmwareToSlot (CHAR * *pPath,* BYTE *slot_index,* BYTE *force_download*)

This API is used to download firmware to a specific slot id of the modem. It is only applicable for EM74xx variant. This API encapsulates all steps involved in the firmware download process.Hence it is a blocking API call.

This API will not return until the entire process has been completed. This API will takes significant amount of time (in order of minutes, normally should be less than 10 minutes).

This API Performs the following steps:

1. Verifies arguments.
2. Retrieve and store the details of the firmware and the PRI file

3. Enable device state change callback.
4. Enable firmware download callback.
5. Set Image preference on the device and reset the device.
6. Wait for the firmware to download and device to become ready.
7. Check the firmware update status. If fail, return an error.
8. If update status is OK, check if current image preference and preferred image preference(from step 2) match
9. If match, firmware download is successful. otherwise, report FW_PREFERENCE_MISMATCH

   10.Disable callbacks and exit.

   The call to this API blocks until step 7 or 10. This could be a significant amount of time (in order of minutes). Also note that the device state change callback and firmware download callback are used internally

   within this API. Hence the user application's instance of these callbacks (if any) are cleared. The user must re-enable these callbacks after a call to this API in order to use them.

Parameters

pPath[IN]	• fully qualified path to firmware image to download.
slot_index[IN]	• slot id in the modem to store the firmware
force_download[IN]	• a flag to force download take place.

Returns

- eQCWWAN_ERR_INVALID_ARG - The path input does not contain any image
- eQCWWAN_ERR_SWIIM_FW_UPDATE_FAIL - Firmware download/switch failed
- eQCWWAN_ERR_SWIIM_FW_PREFERENCE_MISMATCH - Download success but device offline due to image preference mismatch (ref. syslogs for cause)

Note

Timeout: 5 seconds

9.15.4.26 ULONG SLQSUpgradeFirmware9x15 (CHAR * *pDestinationPath*)

This API is used to upgrade firmware on a MC73xx device. This API encapsulates all steps involved in the firmware download process. It is an alternative to any firmware download application. Hence it is a blocking API call. This API will not return until the entire process has been completed.

This API Performs the following steps:

1. Verifies arguments.
2. Retrieve and store the details of the firmware and the PRI file
3. Enable device state change callback.
4. Enable firmware download callback.
5. Set Image preference on the device and reset the device.
6. Wait for the firmware to download and device to become ready.
7. Check the firmware update status. If fail, return an error.
8. If update status is OK, check if current image preference and preferred image preference(from step 2) match
9. If match, firmware download is successful.
10. If do not match, repeat from step 5 once more.
11. Disable callbacks and exit.

    The call to this API blocks until step 7 or 11. This could be a significant amount of time (in order of minutes). Also note that the device state change callback and firmware download callback are used internally

    within this API. Hence the user application's instance of these callbacks (if any) are cleared. The user must re-enable these callbacks after a call to this API in order to use them.

Parameters

pDestination-Path[IN]	• fully qualified path to firmware image to download. The path must end with a forward slash.

Returns

- eQCWWAN_ERR_NONE - Firmware download/Switch success.
- eQCWWAN_ERR_INVALID_ARG - The path input does not contain any image
- eQCWWAN_ERR_SWIIM_FW_UPDATE_FAIL - Firmware download/switch failed
- eQCWWAN_ERR_SWIIM_FW_PREFERENCE_MISMATCH - Download success but device offline due to image preference mismatch (ref. syslogs for cause)

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

See Also

See qmerrno.h for eQCWWAN_xxx error values

Note

Timeout: 12 seconds

9.15.4.28 ULONG upgrade_mc77xx_fw (LPCSTR *path*)

9.15.4.29 ULONG UpgradeFirmware2k (CHAR * *pDestinationPath*)

This API is used to download firmware to a MC77xx or Gobi 3000 device. For SL909/MC9090, SLQSSetSpkg-FormatRequired() needs to be called in advance to specify the download method, Gobi3K or SPKG download, please refer to the API SLQSSetSpkgFormatRequired() for more details of the input values. If SLQSSetSpkg-FormatRequired() is not called in advance, it will us Gobi3K firmware download method (MBN files) as the default download method.

This API Performs the following steps:

1. Verifies arguments.
2. Verify that device Crash State should be 1 (RESET State).
3. Informs the SDK of the firmware upgrade path
4. Updates the images preference on the currently connected device.
5. Requests the device reset (device will reset after all open handles are released).

   Upon successful completion, the above steps will have been completed, however, the actual upgrade of the firmware will necessarily then follow.

Parameters

pDestination-Path[IN]	• fully qualified path to firmware image to download. The path must end with a forward slash. For a Gobi 3000 device the path should specify the carrier image folder index i.e. "<path\to\carrier\image>/<carrier index>/" where <carrier index>=""> is a valid sub-directory entry. For 9x30 devices if pDestinationPath is not valid on host, it will use pseudo path for image switching.

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

9.35.3 Coding Group Bits 7..4(0001)

9.35.3.1 use of bits 3..0

- 0000 GSM 7 bit default alphabet; message preceded by language indication.
  The first 3 characters of the message are a two-character representation of the language encoded according to ISO 639 [12], followed by a CR character. The CR character is then followed by 90 characters of text.
- 0001 UCS2; message preceded by language indication
  The message starts with a two GSM 7-bit default alphabet character representation of the language encoded according to ISO 639. This is padded

to the octet boundary with two bits set to 0 and then followed by 40 characters
of UCS2-encoded message.
An MS not supporting UCS2 coding will present the two character language
identifier followed by improperly interpreted user data.

9.35.4 Coding Group Bits 7..4(0010)

9.35.4.1 use of bits 3..0

- 0000 Czech

- General Data Coding indication
  - Bits 5..0 indicate the following:
  - Bit 5, if set to 0, indicates the text is uncompressed
  - Bit 5, if set to 1, indicates the text is compressed using the compression algorithm defined in 3GPP TS 23.042
  - Bit 4, if set to 0, indicates that bits 1 to 0 are reserved and have no message class meaning
  - Bit 4, if set to 1, indicates that bits 1 to 0 have a message class meaning: Bit 1 Bit 0 Message Class:
    0 0 Class 0
    0 1 Class 1 Default meaning: ME-specific.
    1 0 Class 2 (U)SIM specific message.
    1 1 Class 3 Default meaning: TE-specific (see 3GPP TS 27.005)
    Bits 3 and 2 indicate the character set being used, as follows:
    Bit 3 Bit 2 Character set:
    0 0 GSM 7 bit default alphabet
    0 1 8 bit data
    1 0 UCS2 (16 bit) [10]

This API is used to answer an incoming voice call when the incoming voice call is the only call present at that time. If there are other calls while an incoming call (waiting call) is received, API "SLQSVoiceSendFlash" can be used case of 3GPP2(CDMA) and API "SLQSVoiceManageCalls" in the case of 3GPP(UMTS). If the result indicates success, the device has started the requested operation and it does not mean that the call has been answered. "SLQSVoiceSetAllCallStatusCallback" can be subscribed to check the call Information/State.

Some versions of the modem support the Dual SIM feature. With this feature the modem can register with two different cellular networks simultaneously. Each network registration is associated with a different subscription, e.g., phone number, such that the modem appears to the network to be two different users. By default, the Voice client is bound to the primary subscription. This command allows the Voice client to change this binding. After receiving a successful response to this command, all future commands sent by the client will affect the newly bound subscription only.

9.48.4.9 ULONG SLQSVoiceBurstDTMF (voiceBurstDTMFInfo * *pBurstDTMFInfo*)

See qmerrno.h for eQCWWAN_xxx error values

Note

Technology Supported: CDMA
Timeout: 30 Secs
Applicable only for 3GPP2. This API sends a burst DTMF. If API result indicates success, this means the device has started the requested operation. It does not mean that the burst DTMF request has been sent to the network. A burst DTMF request is sent to the current active/alerting call when CallId is set to 0xFF. This API is applicable only in 3GPP2.

9.48.4.10 ULONG SLQSVoiceDialCall (voiceCallRequestParams * *pCallRequestParams*, voiceCallResponseParams * *pCallResponseParams*)

See qmerrno.h for eQCWWAN_xxx error values

Note

Timeout: 30 Secs
This API originates a voice call (MO). If the function returns success with a call_id, the device has started the requested operation. It does not mean that the call has been connected. SLQSVoiceSetAllCallStatusCallback() callback can be subscribed to learn if the call was successful.

Some of the call-independent services are provided by the network operator as part of the service agreement. If they are not provided by default, the user has to explicitly request them. This API provides the facility to the control point for sending the explicit request to the network for enabling/disabling

9.48.4.31 ULONG SLQSVoiceStartContDTMF (voiceContDTMFinfo * *pContDTMFInfo*)

Starts a continuous DTMF.

Parameters

pContDTMF-Info[IN/OUT]	• Structure containing Continuous DTMF Information. – See voiceContDTMFinfo for more Information.

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

See Also

See qmerrno.h for eQCWWAN_xxx error values

Note

Timeout: 30 Secs
This API starts a continuous DTMF. If the API results indicates success, it means that the device has started the requested operation. It does not mean that the start continuous DTMF request has been sent to the network. A start continuous DTMF request is sent to the current active/alerting call when CallId is set to 0xFF.

9.48.4.32 ULONG SLQSVoiceStopContDTMF (voiceStopContDTMFinfo * *pVoiceStopContDTMFinfo*)

Stops a continuous DTMF.

Parameters

pVoiceStopCont-DTMFinfo	• Structure containing Continuous Stop DTMF Information. – See voiceStopContDTMFinfo for more information. • Start continuous DTMF request is sent to the current active/alerting call when CallId is set to 0xFF. • This is IN/OUT params, value passed by user will packed in request and before unpacking response this will be assigned with an invalid callID value "0". It change to a valid value if received as part of response otherwise Invalid value will be present.

Returns

eQCWWAN_ERR_NONE on success, eQCWWAN_xxx error value otherwise

See Also

See qmerrno.h for eQCWWAN_xxx error values

Note

Timeout: 30 Secs
This API starts a continuous DTMF. If the API results indicates success, it means that the device has started the requested operation. It does not mean that the start continuous DTMF request has been sent to the network. A stop continuous DTMF request is sent to the current active/alerting call when CallId is set to 0xFF.

9.57.2 Macro Definition Documentation

9.57.2.1 #define MEMSET_STATIC_OUTPUT_STRUCT(*OUTPUT_PARA, STRUCT_OF_OUTPUT_PARA*) memset(OUTPUT_PARA,0,sizeof(STRUCT_OF_OUTPUT_PARA));\

Macro used to memset unpack output paramter. To prevent output parameter is not inititalized.

9.57.2.3 #define QMI_TLV_PLACEHOLDER 0x8F

9.57.2.4 #define SWI_API

9.57.2.5 #define UNUSEDPARAM(*x*) (void)x

Macro used to avoid “unused variable” compiler warnings generated due to the inclusion of the "-Wextra" flag in our make files.
